

ABSTRACT OF THE DISCLOSURE

A double doll figurine which is constructed of an outer doll which is constructed of an outer doll which has a hollow internal chamber and within the hollow internal chamber is to be located an inner doll. The outer doll is constructed of a top and a base which are capable of being separated. When the top and base are connected together, they are connected by a fastener arrangement with generally a magnetic fastener arrangement being preferred. Each of the magnetic fasteners is mounted within a post mounted in the base with each of these posts protruding within the internal chamber. The posts cooperate with members of the inner doll to restrict the movement of the inner doll within the internal chamber so the posts, in essence, function as a movement limiter.
